in combination, **all** the limitations of the independent claims of the current invention (claims 1 and 6), particularly method and apparatus for running an execution image containing instructions for running a computer program comprising a non-volatile memory configured to store a version of the execution image, a volatile memory configured to execute the execution image, a decompression code in the non-volatile memory and a computing unit configured to transfer the version of the execution image from the non-volatile memory to the volatile. The prior arts of record do not specifically discloses *the computing unit uses a first and an optional second header, the optional second header indicating whether the version of the execution image is a compressed version, and decompressing the compressed version using the decompression code.* In light of the foregoing, claims 1 and 6 of the present application is found to be patentable over the prior arts.
